Project 6 ReadMe

Mike Roylance

roylance@uw.edu

Language coded	Java	
Approach	I created 8 classes to help me complete this project	
	App.java	This class was just the entry point of the application. It received the filename and output to the console the results.
	ICostFunction.ja va	This is an interface that I used with the the Command pattern for implementing the cost function for EditDistance.
	CharCostFunctio n.java	This class was the cost function for comparing strings. It implemented ICostFunction.
	StringsCostFunc tion.java	This class was the cost function for comparing arrays of strings. It also had a reference to CharCostFunction. It also implemented ICostFunction.
	DistFunctions.ja va	This was a static class that ran the EditDistance algorithm. It took in a command to implement the cost function.
	Tuple.java	I stored my results in a Tuple when outputting to the console. I using this data structure in .NET.
	Tests.java	This was where all of my tests are. I created some on my own, but I also used some of yours off the site (thank you!).
Problems	This was a fun project! I probably spent the most time with this project compared to the others (as evident by the number of classes I created to help me solve the problem), but I enjoyed it. I could refactor this code down to be a bit easier to read (and follow SOLID design principles), but I think it is readable enough right now.	
Results	Please look at output.txt created from condor.cmd for more information. Also I have posted this in this readme.pdf as well. I added angle brackets (<>) to help identify the different lines.
